SHORT BIOGRAPHY

1993

Conceived in *Le Cul-de-sac du Marin* (Martinique) by adventurous parents.

28 August 1994 - 8:01 am

Born in Morges (Switzerland).

1995

Start of engineering career with my father; building objects using various materials (cardboard, PVC pipes, ropes, tape, etc.).

1996

First time sailing on the *Léman* (**not** Lake Geneva).

1998-2008

Start of a research lab, first with Ulysse Wicky and later joined by Thierry Bujard. The research consists mostly of building medieval weapons and catapults (and eventually breaking stuff).

2004

After wanting to be a farmer for 10 years, I decided that I would become a naval architect.

2014

After struggling through my Federal maturity exam, I left Switzerland to study naval architecture in Southampton (UK).

2017

Bachelor (with *Distinction*) in Yacht & Powercraft design in Southampton, followed by a Master in computational fluid dynamics (with *Distinction*). To the deepest regret of my mum, I missed both graduation ceremonies (I was sailing).

2023

Thesis in computational fluid-structure interaction in Southampton with Gabriel Weymouth and Georges Limbert, who taught me science, resilience and a lot of computational mechanics.

2025

I finally understand how the human heart works, thanks to Mathias Peirlinck, who taught me more computational mechanics and mentoring.
